## **Subject: CU1526 and CU2026 On-Off Switch Removal**

Beginning with CU1526SA-1A serial number 12021320013140, the on-off switch on the front of the machines has been removed from production of all versions of the above models. The wire harness that connected it to the transformer is also discontinued. No part numbers were changed.

Stopping or starting the machine now requires removal of the left front grill to access the controller buttons.

In order to make this change the right grill, part number 02-4304-01, has been modified by removal of the mounting hole for the switch. If replacing a grill on a unit that has the on-off switch, and the replacement grill does not have the mounting hole, the switch and harness can either be removed from the transformer load circuit (remove switch & harness and plug controller directly into transformer load) or the switch placed in the notch on the access valve bracket, located behind the grills.
