Subject: HID/MDT Container Sensors

HID312, HID525, HID540, MDT3, MDT4, MDT5 and MDT6 ice maker-dispensers use infrared triangulation sensors to identify when a container is positioned for ice or water dispensing.

Because infrared is light, the container must be able to reflect light. Clear glass containers do not always provide adequate reflection. However, a hand holding the glass will activate the sensor, as fingers around the glass will reflect the light.
