Subject: Change to Water Shed used on 1/4 HP Gear Reducers

The water shed has had a design and part number change.

The new water shed, part number **02-4663-01**, replaces 13-0868-01, which is no longer available.

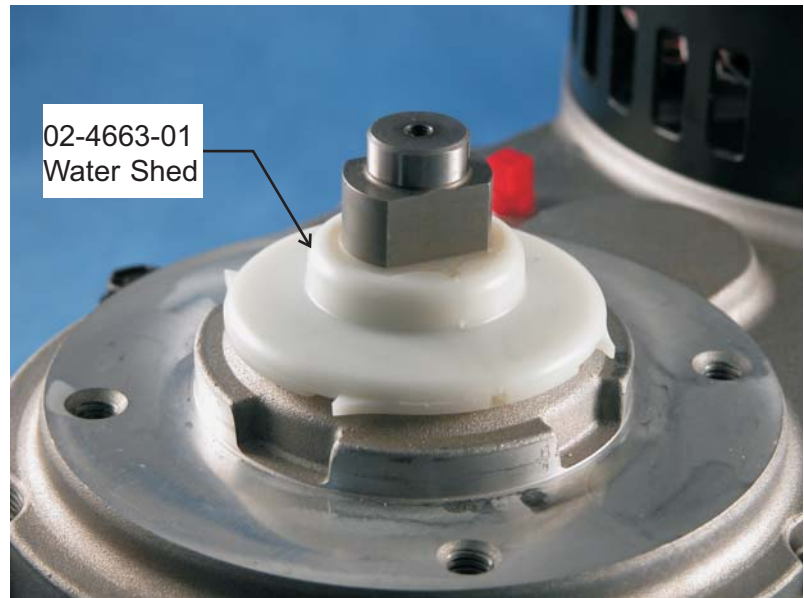

The water shed is positioned between the water seal and the gear reducer. Its function is to route condensation and/or leaking water away from the gear reducer output shaft.

The improvements include:

- Tighter fit to output shaft
- Firmer material, stays flat, does not round out
- Improved drip edge
- Sweep features to keep the drain path clear

All the above are intended to reduce water infiltration potential and improve gear reducer life.

Use began with units produced September 26, 2011.
